### ALIGNMENTS

New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability. /label= OTHER /note= "OTHER= H2NC(=NH)NH(CH2)CO. Beta-Ala (not defined)" platelet aggregation inhibitor; guanidino group; amidino group. Takiguchi Y; Platelet aggregation inhibitor peptide #146. Location/Qualifiers ADD95004 standard; peptide; 1 AA. Katada J, 94WO-JP000999. 93JP-00186755 (first entry) (YAWA ) NIPPON STEEL CORP. Hayashi Y, WPI; 1995-060950/08 Key Modified-site 22-JUN-1994; 30-JUN-1993; 29-JAN-2004 WO9501371-A1 Jnidentified 12-JAN-1995. ADD95004;

guanidino or amidino gp. at N-terminal to increase stability.

Disclosure; Page 11; 34pp; Japanese.

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.

RESULT 2 ADD94992

```
The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with escallent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                         /label= OTHER /note= H2NC(=NH)NH(CH2)CO. Beta-Ala (not defined)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 platelet aggregation inhibitor; guanidino group; amidino group.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                            - contain

(I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or andidno group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                          The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes peptides of amino acid sequence (I) and their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guandino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention describes peptides of amino acid sequence (I) and their

                                                                                                                                                          g
                                                                                                                                           ð
                                                                                                                                                                                                                                                      ..
                                                                                                                                                  The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                          New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.

(I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                 New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                   /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                          - contain
                                                                                                                                                                                                                                                                          New RGD peptide(s) useful as anti:platelet aggregation agents guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 1;

J. Bacteriol. 172:6797-6802(1990).
-!- FUNCTION: Acyl-protein synthetase activates tetradecanoic acid. It
is a component of the farty acid reductase complex responsible for converting tetradecanoic acid to the aldehyde which serves as substrate in the luciferase-catalyzed reaction.
-!- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate +
 Homo sapiens (Human).

Amidation; Direct protein sequencing; Pyrrolidone carboxylic acid.

MOD_RES 1 Pyrrolidone carboxylic acid.

MOD_RES 3 Proline amide.

And ABS 3 Proline Amide.

J. Pept. Protein Res. 39:258-264(1992). FUNCTION: Neuroexcitatory peptide; increases the impulse frequency and produces a spike broadening of the identified heart excitatory neuron (PON); also enhances the amplitude and frequency of the heart beat. Has also an effect on several other muscles.
                                                                                                                                                                      Eukaryota, Metazoa, Mollusca, Gastropoda, Pulmonata, Stylommatophora,

Natl. Acad. Sci. U.S.A. 72:4123-4127(1975).
-!- MISCELLANEOUS: These peptides are released from mast cells in lung (and other tissues) during hypersensitivity reactions (anaphylaxis). Their activities, preferentially affecting eosinophils, include chemotaxis, chemotactic deactivation, release of enzymes, and stimulation of the hexose monophosphate shunt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

CONTRY: USA

ZIP: 10.12

ZIP: 10.12

COMPUTER: BM PC Compatible

COMPUTER: BM PC COMPATION

MEDIUM TYPE: PLOUDY disk

COMPUTER: BM PC COMPATION

COMPUTER: 1950113

CURRENT APPLICATION NUMBER: US/07/820,154A

PILING DAFE: 1950113

CLEASIFICATION NUMBER: US/07/820,154A

ATTORNEY/AGET INPORMATION:

MAME: White, John P

TELEPRA: (212) 664-0525

TELERA: (212) 664-0525

TELERA: (212) 664-0525

TELEN: A22523

INPORMATION POR SEQ ID NO: 12:

SEQUENCE CHARACTERISTICS:

LENGTH: 1 amino acids

TTELEX: A22523

TOPOLOGY: linear

WOLECULE TYPE: Protein

Brown TJ, Brownlee GR; Novel compound capable of reducing level, function or activity of hyaluronan synthase or hyaluronidase, useful for treating cancer, hyperproliferative condition, A-beta-lipoproteinemia, A-V, A beta-2-microglobulin amyloidosis.

WPI; 2005-315540/32.

Example 22; SEQ ID NO 50; 277pp; English.

This invention describes a novel nucleic acid molecule capable of reducing the level of hyaluronan synthase (HAS) or hyaluronidase (HYAL) or the function or activity of HAS or HYAL. HAS is selected from HAS1, HAS2 and HAS3. HYAL is chosen from HYAL1, HYAL2, HAL3 and PH-20. The nucleic acid molecule is an oligonucleotide or its chemically modified form comprising a chemically modified backbone or a non-natural internucleoside linkage. The compound is an interactive molecule capable of binding or otherwise associating with HAS and/or HYAL to reduce HAS

                  treating cancer, hyperproliferative conditions or inflammatory conditions. The products of the invention are useful for treating or prophylaxis of a condition in subject, which involves administering to the subject, an HAS and/or HYAL level-reducing or HAS and/or HYAL activity reducing effective amount of active molecule. The products of ectivity reducing effective amount of active molecule. The products of neuroprotective, antianemic, cytostatic, anti-inflammatory, endocrinegen. and immunosuppressive activity. This sequence represents a peptide used in the method of the invention, NOTE: The specification describes SEQ ID NO 27-51 as nucleotide primers however the Sequence Listing represents the nucleotides in a three letter amino acid code. The nucleotides sequences have been made and are represented in { }
